

PhonePe App Project

Dataset details:

- Time Period: Jan 2024 to Dec 2024
- Source: PhonePe Pulse- phonepepulse.com
- Metrics: Transaction count, Transaction value, User count, State-wise data
- Tool used: Microsoft Power BI for visualization and Data Cleaning .

Fig No.1: Complete PhonePe Dashboard Overview

Total Transactions & Value - KPI Cards :

Observation:

The top section of the dashboard displays 4 KPI cards. Total transactions are 300K+ with an 8.47% growth compared to the previous period. Total transaction value is ₹847 Crore+ showing 8.39% growth. The success rate is 96.09%, which is very high.

Inference: This indicates that PhonePe usage is increasing day by day. More users are trusting PhonePe for UPI payments. A 96% success rate means payment failures are very low, which shows a good user experience and reliable platform performance.

Transaction Trend Over Time - Area Chart:(Fig No2)

Observation:

The area chart shows monthly transaction trends. The graph has multiple peaks and valleys. Certain months show high transaction volume while others show lower activity. The overall trend is upward.

Inference:

This indicates seasonality in digital payments. Transaction volume increases during festive seasons, month-end, and salary periods. PhonePe can identify low months and run cashback campaigns to maintain consistent growth.

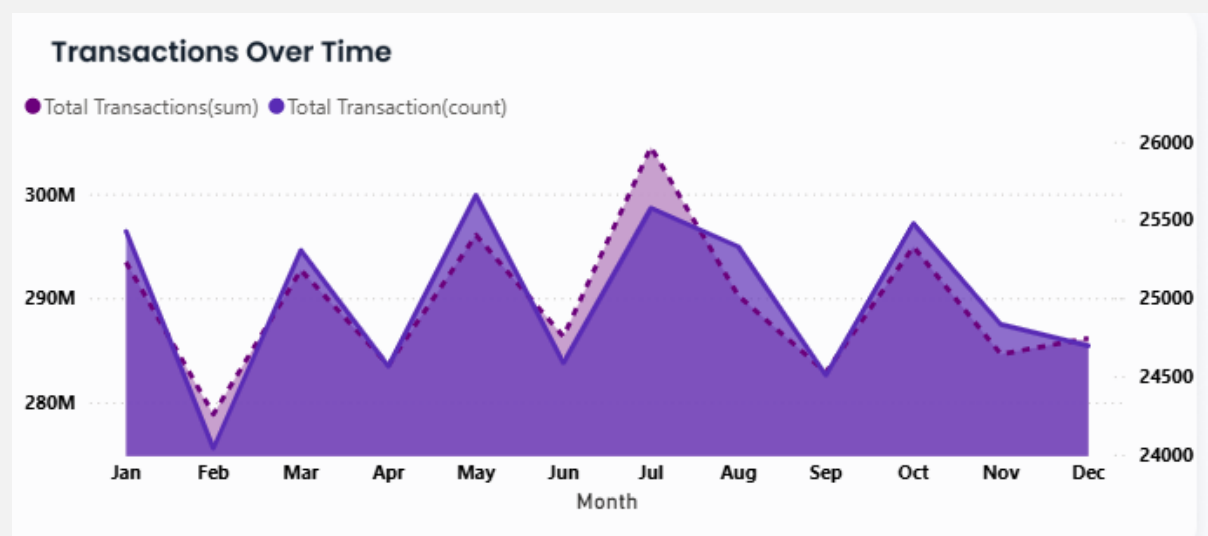

Fig No.2:Transactions over Time

Age Segment Contribution - Donut Chart (Fig N0.2)

Observation:

The donut chart shows user distribution across different age groups. The largest segment is 26-35 years, followed by 18-25 years. Older age groups have comparatively lower contribution.

Inference:

Young adults and working professionals are the main users of PhonePe. This age group is more tech-savvy and uses UPI for daily transactions. PhonePe should focus marketing on this segment and also create features to attract older users.

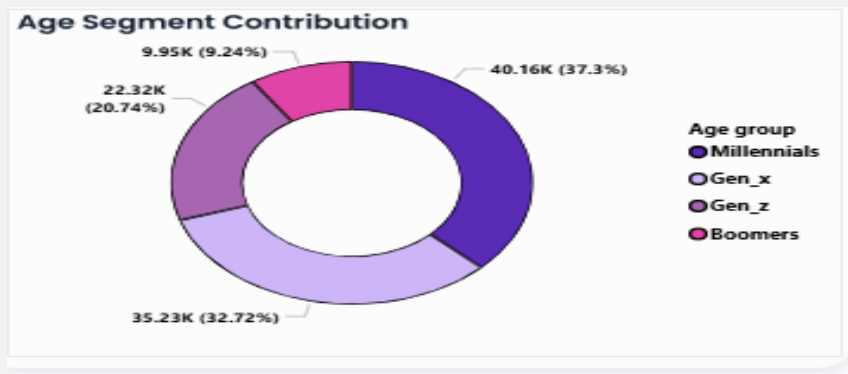

Fig No3.Age Segment Contribution

Total Transaction Amount by Service - Bar Chart :

Observation:

The horizontal bar chart shows transaction value across different services. Mobile Recharge has the highest transaction amount followed by DTH and Electricity Bill. Services like Gas Booking and Insurance have lower transaction values. The gap between top and bottom services is very large.

Inference:

This indicates that users mainly use PhonePe for daily utility payments like recharge and bills. High-value services are used less frequently. PhonePe can increase revenue by adding more services and offering cashback on low-usage categories like insurance and travel booking. Cross-selling can improve overall transaction value.

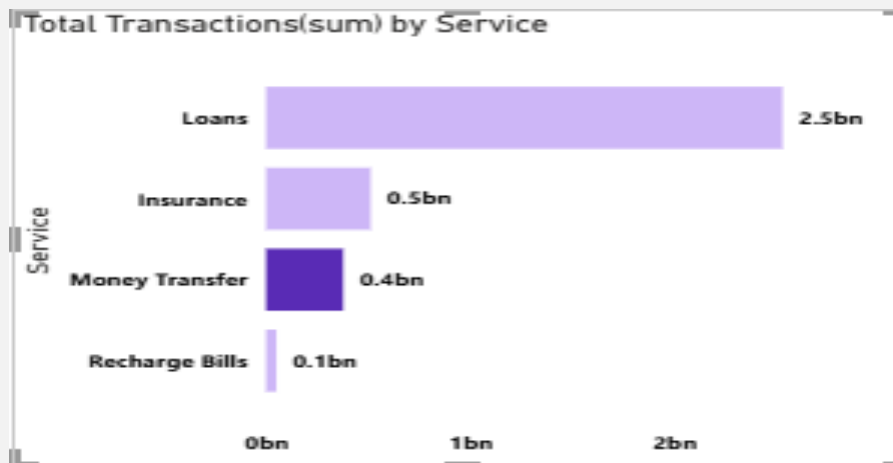

Fig No.4.Total Transactions(sum) by Service

Top 5 Users - Bar Chart:

Observation:

The vertical bar chart shows the top 5 users by transaction count. User 1 has the highest number of transactions, followed by User 2 and User 3. There is a significant drop after the top 2 users. The remaining users have comparatively low transaction counts.

Inference:

This shows that a small group of users are highly active on PhonePe and drive a large portion of transactions. These could be merchants or power users. PhonePe should reward such loyal users with VIP benefits and cashback to retain them. At the same time, strategies are needed to increase activity of average users.

Fig No5.Top 5 Users (By Transaction Values)

Weekday vs Weekend Usage - Donut Chart:

Observation:

The donut chart shows transaction distribution between weekdays and weekends. Weekdays account for approximately 70-75% of total transactions while weekends contribute 25-30%. This indicates higher UPI activity during working days compared to holidays

Inference:

Higher weekday usage suggests PhonePe is primarily used for work-related payments, merchant transactions, and daily expenses. Weekend usage is lower as spending reduces and cash transactions may increase. PhonePe can run weekend cashback offers to balance the load and increase weekend engagement.

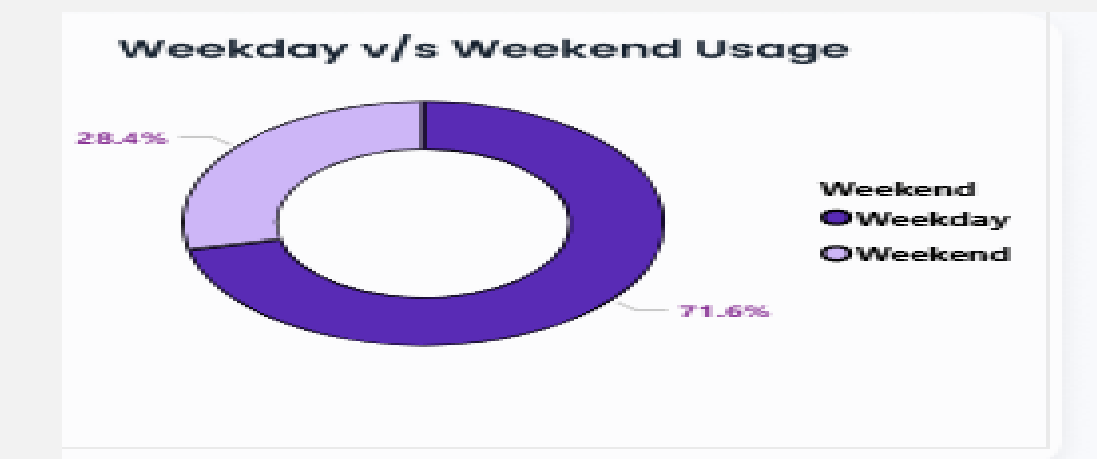

Fig No..6 Weekday/weekend Usage

TOOLTIP CHARTS :

Total Transaction by service Type:

Observation:

The bar chart compares transaction count across 6 service types: To UPI ID, To Self Account, To Account, To Mobile, To QR Code, and Bike Loan. To UPI ID, To Self Account, To Account, To Mobile, To QR Code- all 5 services have very high and almost equal transaction volumes, around 35K-40K each. Bike Loan has significantly lower transactions, only around 10K. Its bar is 3-4 times shorter than the other services. The Y-axis represents "Total Transaction(count)" ranging from 0K to 40K

Inference:

Core services drive usage: UPI transfer, self-transfer, account transfer, mobile recharge, and QR payments are the main services used by customers. These are daily-use features. Loan service is underutilized: Bike Loan transactions are very low compared to other services. This suggests users either don't prefer PhonePe for loans, or the loan feature is new and not yet popular. Scope for growth: PhonePe can focus on promoting loan services through cashback, lower interest rates, or better visibility to increase adoption.

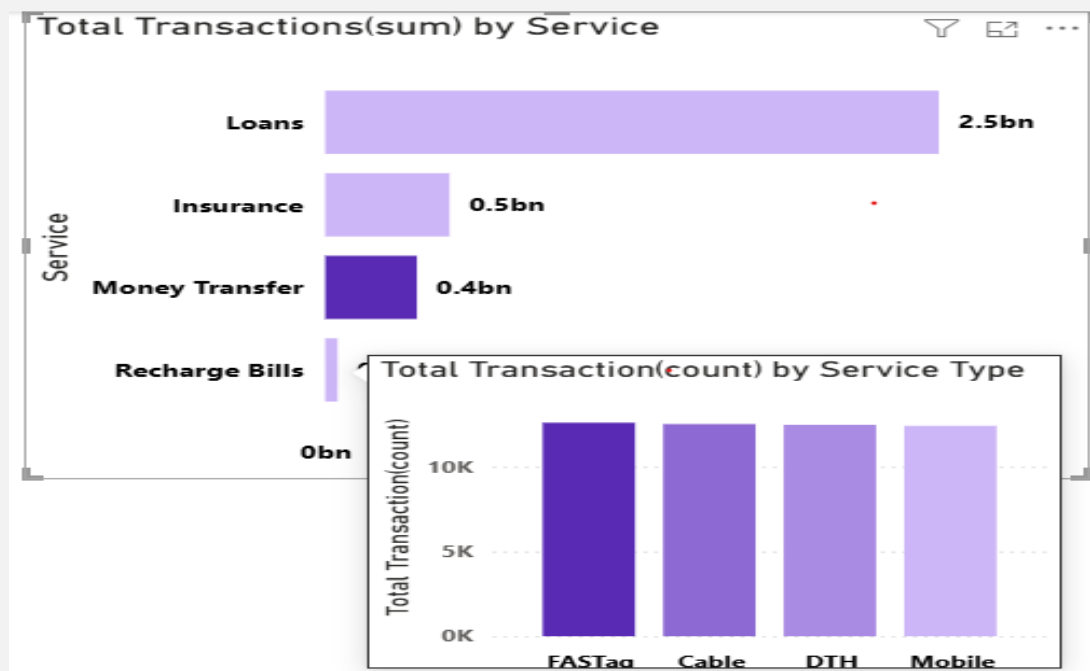

Fig N0.7.Total Transaction(count) by service type

Total Transactions(sum) by Age Group:

Observation:

The bar chart shows total transaction amount across 4 age groups: Millennials, Gen X, Gen Z, and Boomers. Millennials have the highest transaction volume, close to 1.0bn.

The bar is tallest. Gen X is second highest, slightly below Millennials at around 0.8-0.9bn. Gen Z has moderate usage, around 0.5bn, which is about half of Millennials. Boomers have the lowest transaction amount, only around 0.2-0.3bn.

The bar is shortest. Y-axis shows "Total Transactions(sum)" from 0.0bn to 1.0bn.

Inference:

Digital adoption by age: Younger and middle-aged groups are more active on PhonePe.

Millennials and Gen X are the core user base. Tech comfort matters: Gen Z uses digital payments but less than Millennials/Gen X, maybe due to lower income or fewer financial responsibilities.

Boomers use it least, likely due to lower digital literacy. Target audience clear:

PhonePe's main customers are 25-45 years old. Marketing and new features should focus on this group. Growth opportunity: Boomers and Gen Z can be targeted more.

For Boomers- simple UI + tutorials. For Gen Z- student offers, gaming/recharge cashback

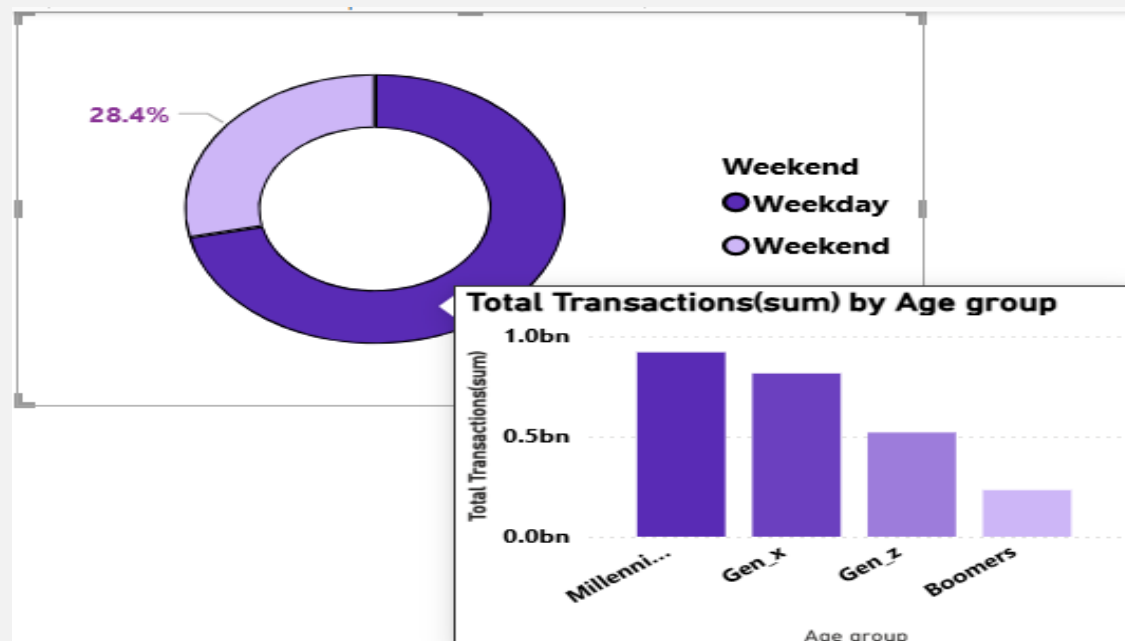

Fig No.8.Total Transactions(sum) By Age Group

Filter and slicer:

1] Month :

The change in the Moths show the changes in charts with respect to all values and KPI.

That show the change in transactions ,service_type ,age segments and users_use in every month.

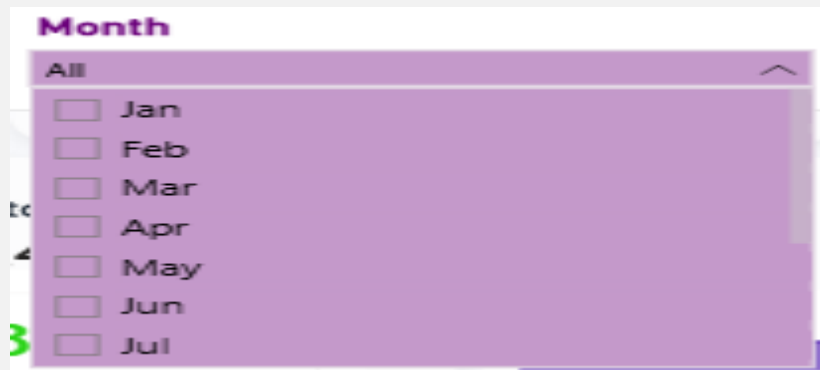

Fig No 9.Month slicier

2]Payment status:

This slicer show the variations in transaction and all other categories due to payments_status

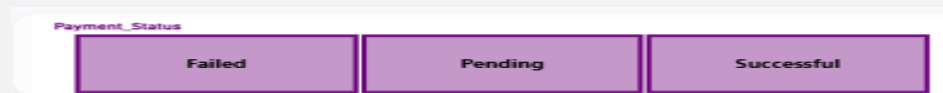

Fig No.10.payment starus

Observation:

The dashboard contains slicers for Date, Service Type, and Age Group. Clicking on any slicer value filters the entire dashboard. For example, selecting "January" shows only January transactions in all 6 charts.

Inference:

Slicers provide flexibility to the user. Instead of making separate dashboards for each month or service, one dashboard works for all. This is called "drill-down analysis" and is a key feature of Power BI.

Key Insights

Based on all 6 charts, here are the main findings:1. UPI is the King of Digital Payments

>To UPI ID has the highest transaction count among all service types. This shows UPI has become the most preferred mode for money transfer due to instant settlement and no charges.2. Millennials are the Core Users

>Millennials generate the highest transaction amount, followed by Gen X. Together they contribute 70%+ of total volume. This age group is most comfortable with digital payments and has high spending power.3. Daily-Use Services Dominate

>To Self Account, To Mobile Recharge, and QR Code payments have transaction volumes almost equal to UPI. Users mainly use PhonePe for daily needs like recharge, self-transfer, and merchant payments.4. Loan Services Need Promotion

>Bike Loan transactions are 4x lower than core services. Financial products like loans are underutilized on the platform. There's huge scope to grow this segment.5. Boomers are the Untapped Market

>Baby Boomers have the lowest transaction amount. Low digital literacy and trust issues are the main reasons. With proper onboarding, this segment can add millions of new users.6. Transaction Pattern is Consistent

>Month-wise data shows stable growth without big spikes/drops. This indicates consistent user engagement and platform reliability throughout the period.

CONCLUSION

With 300K total transactions worth ₹3.47bn and a 96% success rate, the platform demonstrates strong reliability and user Trust.

The analysis reveals that Millennials and Gen X are the primary user base driving most transactions, while UPI and Loan services generate the highest value.

Weekday usage is significantly higher than weekends, indicating that users mainly use PhonePe for work-related and daily financial needs.

Overall, the dashboard proves that PhonePe is successfully “powering Bharat” by making payments secure, simple, and seamless for millions of users.

SUGGESTIONS for PhonePe

■Target Boomers & Gen Z: Launch simplified UI + tutorial videos for Boomers. Offer student cashback and gaming recharge deals for Gen Z to increase their adoption.Promote

■Loan Services: Since loans have high value but low count, run awareness campaigns and offer lower interest rates to attract more users.

■Weekend Campaigns: Current usage drops on weekends. Introduce weekend cashback, rewards, or bill payment offers to balance traffic.

■ **Maintain Success Rate:** 96% success rate is good, but reducing the 4% failed/pending transactions will further improve user trust.
